

Abstract

A protective layer (7) which is relatively permeable for CO_2 and relatively impermeable for SO_2 is designed so as to yield a reduced penetration time for CO_2 molecules.

The protective layer (7) is composed of a gas-permeable carrier (10) made of a material which is resistant to sulfuric acid media such as SO_2 and SO_3 , has a surface (8) that can be exposed to a gas and is provided with an oxidizing agent whose oxidation potential is sufficient to oxidize SO_2 .
